📁 East Side Server — Upload & Routing Logic

Overview

The **East Side Server** is a lightweight Python HTTP server designed to accept file uploads and automatically route them into predefined directories based on **filename prefixes**. This approach enforces consistent organization while keeping the upload workflow simple and deterministic.

Uploads are handled using standard HTTP multipart requests, and all routing decisions are made server-side.

Upload Workflow

1. A client uploads a file using `multipart/form-data`
2. The server temporarily stages the file in the `uploads/` directory
3. The filename prefix is evaluated
4. The file is moved to its final destination using `shutil.move()`
5. Files without a recognized prefix are routed to the default directory

No files remain in the staging directory after processing.

Directory Routing Rules

Filename Prefix	Destination Directory
`orchid_`	`orchids/`
`doc_`	`docs/`
`after_`	`after-work/`
`assign_`	`assignments/`
(no prefix)	`assignments/`

Routing rules are **hard-coded by design** and provide predictable file placement.

Directory Structure

```
east-side-server/
├── after-work/
├── assignments/
├── docs/
├── orchids/
```

```
├── uploads/          # Temporary staging only
├── images/
├── index.html
├── server.py
├── success.png
└── venv/
```

Logging

All uploads and routing actions are logged using Python’s `logging` module.
Each successful upload produces a log entry confirming:

- Upload completion
- Filename evaluated
- Routing destination

This allows easy verification and troubleshooting without additional tooling.

Design Considerations

- Uses Python’s built-in HTTP server for simplicity
- Multipart handling relies on the standard library
- Atomic file moves via `shutil.move()`
- Automatic directory creation
- No test-specific or conditional logic
- Deterministic, prefix-based routing

The design favors **clarity, predictability, and maintainability**.

Status

The upload and routing logic is **fully functional and stable**.
The server is ready for extension, documentation, or deployment.
