

POS Build Recap (Progress as of Jan 13, 2026)

What's Working

- ☐ Item selection from lookup form
-  Price, Quantity, Line Total logic
-  Tax and Total calculation (10%)
-  Transaction logging to `Sheet_Transactions`
-  Cash handling with Tendered amount and Change calculation
-  Credit/Card process flows without needing change
-  Receipt printed to Immediate Window
-  Form UI: `lstScan`, `cmbPaymentType`, `txtTendered`, `txtQty`, etc.
-  Correct visibility toggling for cash-only fields

Example Log Output in Sheet

Timestamp	Item	Price	Qty	Line Total	Subtotal	Tax	Total	PayType	Tendered	Change
1/13/2026 1:01	COFFEE	3.25	4	13.00	15.00	1.50	16.50	Cash	20.00	3.50

Next Build Phase (Pick up here tomorrow)

Task	Description
 Finish field label names	Ensure <code>lblTender</code> , <code>lblChange</code> exist (or remove from code if unused)
 Prevent duplicate items	Merge existing item rows instead of adding new line for same product
 Transaction ID / Receipt#	Auto-generate an ID for each receipt (e.g., T-1001, T-1002...)
 Export receipt to TXT	Write receipt content to <code>.txt</code> file or save to archive folder
 Sales summary report	Show totals by day, item, or payment type (end-of-day closure reporting)
 Form robustness	Disable <code>Print</code> unless a pay type is selected and cart has at least 1 item

Notes for Clean Continuation

- Confirm all TextBox and Label names match those in your code
 - Save a backup `.x1sm` just in case before adding bigger features
 - Keep form modular: don't hardcode sheet names or control references
-

Wrap-Up

You're building a modular, simulation-ready **POS System** for cyber-range deployment that mimics real café logic — with payment routing split by subnet (credit) and all local cash handling locked in  

 **Tomorrow's mission:** Optimize, enhance, and polish to v1.

See you in the next session — we'll continue building like legends   

— • Excel VBA • out.
