

Here's a complete, **step-by-step prep guide** to get you ready for a clean and successful install of **Empire + Starkiller (GUI frontend)**.

✓ **Phase 1: Update Your System**

```
sudo apt update && sudo apt upgrade -y
```

✓ **Phase 2: Install Required Dependencies**

```
sudo apt install -y \  
    git \  
    curl \  
    wget \  
    python3 \  
    python3-pip \  
    python3-venv \  
    build-essential \  
    libssl-dev \  
    libffi-dev \  
    python3-dev \  
    mysql-server \  
    libmysqlclient-dev \  
    jq \  
    unzip \  
    lsb-release
```

These are needed for Python, Empire's database, and crypto modules.

✓ **Phase 3: Clone and Install Empire**

```
cd ~  
git clone https://github.com/BC-SECURITY/Empire.git  
cd Empire  
./setup/install.sh -y
```

This script:

- Sets up a virtual environment
 - Installs all Python dependencies
 - Initializes MySQL database
 - Configures Empire backend
-

✓ Phase 4: Run Empire Server

```
./empire.py server
```

After launch:

- It will generate certs
- Start the API backend
- Serve the GUI at `http://localhost:1337`

Leave this running in one terminal.

✓ Phase 5: Download & Run Starkiller (GUI)

1. Go to Starkiller Releases
 2. Download the `.AppImage` file for **Linux**
 3. Make it executable:
 4. `chmod +x Starkiller-*.AppImage`
 5. Run it:
 6. `./Starkiller-*.AppImage`
-

✓ Phase 6: Login to GUI

Open a browser or use Starkiller:

- URL: `http://localhost:1337`
- Default creds (unless you've changed them):
 - **Username:** `empireadmin`
 - **Password:** `Password123!`

🔒 You can reset or rehash the password using `bcrypt` if needed.

✓ Optional (for remote access or testing agents)

- Allow port 1337 through firewall:
- `sudo ufw allow 1337`
- Ensure MySQL is running:
- `sudo systemctl start mysql`
- `sudo systemctl enable mysql`

At This Point You Can:

- Create Listeners (`uselistener http`)
- Generate Agents (`usestager multi/launcher`)
- Receive callbacks from targets (e.g., via Evil-WinRM or DLL hijack)
- Interact with agents via GUI or CLI

TL;DR (Fast Recap)

```
sudo apt update && sudo apt install -y git python3-venv mysql-server ...
git clone https://github.com/BC-SECURITY/Empire.git
cd Empire
./setup/install.sh -y
./empire.py server
```

Then run Starkiller GUI and log in.
